

Open and Honest Care in your Local Hospital

The *Open and Honest Care: Driving Improvement* programme aims to support organisations to become more transparent and consistent in publishing safety, experience and improvement data; with the overall aim of improving care, practice and culture.

Report for:

**The Rotherham NHS
Foundation Trust**

October 2014

Open and Honest Care at The Rotherham NHS Foundation Trust : October 2014

This report is based on information from October 2014. The information is presented in three key categories: safety, experience and improvement. This report will also signpost you towards additional information about The Rotherham NHS Foundation Trust's performance.

1. SAFETY

Safety thermometer

On one day each month we check to see how many of our patients suffered certain types of harm whilst in our care. We call this the NHS Safety Thermometer. The safety thermometer looks at four harms: pressure ulcers, falls, blood clots and urine infections for those patients who have a urinary catheter in place. This helps us to understand where we need to make improvements. The score below shows the percentage of patients who did not experience any harms.

95.1% of patients did not experience any of the four harms in this trust.

For more information, including a breakdown by category, please visit:

<http://www.safetythermometer.nhs.uk/>

Health care associated infections (HCAIs)

HCAIs are infections acquired as a result of healthcare interventions. Clostridium difficile (C.difficile) and methicillin-resistant staphylococcus aureus (MRSA) bacteremia are the most common. C.difficile is a type of bacterial infection that can affect the digestive system, causing diarrhoea, fever and painful abdominal cramps - and sometimes more serious complications. The bacteria does not normally affect healthy people, but because some antibiotics remove the 'good bacteria' in the gut that protect against C.difficile, people on these antibiotics are at greater risk.

The MRSA bacteria is often carried on the skin and inside the nose and throat. It is a particular problem in hospitals because if it gets into a break in the skin it can cause serious infections and blood poisoning. It is also more difficult to treat than other bacterial infections as it is resistant to a number of widely-used antibiotics.

We have a zero tolerance policy to infections and are working towards eradicating them; part of this process is to set improvement targets. If the number of actual cases is greater than the target then we have not improved enough. The table below shows the number of infections we have had this month, plus the improvement target and results for the year to date.

	C.difficile	MRSA
This month	1	0
Improvement target (year to date)	9	0
Actual to date	14	0

Pressure ulcers

Pressure ulcers are localised injuries to the skin and/or underlying tissue as a result of pressure. They are sometimes known as bedsores. They can be classified into four grades, with one being the least severe and four being the most severe.

This month 10 Grade 2 - Grade 4 pressure ulcers were acquired during hospital stays.

Severity	Number of pressure ulcers
Grade 2	5
Grade 3	5
Grade 4	0

So we can know if we are improving even if the number of patients we are caring for goes up or down, we also calculate an average called 'rate per 1,000 occupied bed days'. This allows us to compare our improvement over time, but cannot be used to compare us with other hospitals, as their staff may report pressure ulcers in different ways, and their patients may be more or less vulnerable to developing pressure ulcers than our patients. For example, other hospitals may have younger or older patient populations, who are more or less mobile, or are undergoing treatment for different illnesses.

Rate per 1000 bed days:	0.87
-------------------------	------

Falls

This measure includes all falls in the hospital that resulted in injury, categorised as moderate, severe or death, regardless of cause. **This includes avoidable and unavoidable falls sustained at any time during the hospital admission.**

This month we reported 3 fall(s) that caused at least 'moderate' harm.

Severity	Number of falls
Moderate	2
Severe	1
Death	0

So we can know if we are improving even if the number of patients we are caring for goes up or down, we also calculate an average called 'rate per 1,000 occupied bed days'. This allows us to compare our improvement over time, but cannot be used to compare us with other hospitals, as their staff may report falls in different ways, and their patients may be more or less vulnerable to falling than our patients. For example, other hospitals may have younger or older patient populations, who are more or less mobile, or are undergoing treatment for different illnesses.

Rate per 1,000 bed days:	0.26
--------------------------	------

2. EXPERIENCE

To measure patient and staff experience we use a Net Promoter Score.

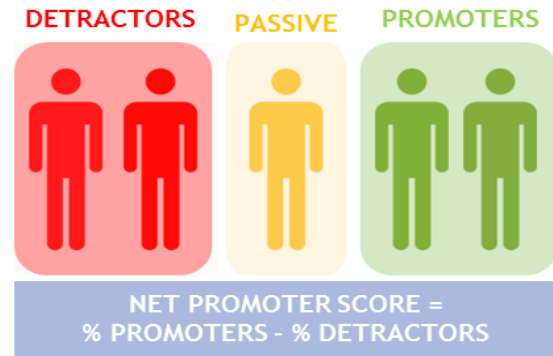

The idea is simple: if you like using a certain product or doing business with a particular company you like to share this experience with others.

From the answers given 3 groups of people can be distinguished:

Detractors - people who would probably not recommend you based on their experience, or couldn't say .

Passive - people who may recommend you but not strongly.

Promoters - people who have had an experience which they would definitely recommend to others.

This gives a score of between -100 and +100, with +100 being the best possible result.

Patient experience

The Friends and Family Test

The Friends and Family Test (FFT) requires all patients, after discharge, to be asked: *How likely are you to recommend our ward to friends and family if they needed similar care or treatment?* We ask this question to patients who have been an in-patient and/or attended Accident & Emergency (A&E). Both scores (if applicable) are below;

In-patient FFT score*

65

This is based on 516 responses.

A&E FFT score*

45

This is based on 963 responses.

*This result may have changed since publication, for the latest score please visit:

<http://www.england.nhs.uk/statistics/statistical-work-areas/friends-and-family-test/friends-and-family-test-data/>

We also asked 80 patients the following questions about their care:

	Net Promoter Score
Were you involved as much as you wanted to be in the decisions about your care and treatment?	45
If you were concerned or anxious about anything while you were in hospital, did you find a member of staff to talk to?	39
Were you given enough privacy when discussing your condition or treatment?	45
During your stay were you treated with compassion by hospital staff?	73
Did you always have access to the call bell when you needed it?	64
Did you get the care you felt you required when you needed it most?	66
How likely are you to recommend our ward/unit to friends and family if they needed similar care or treatment?	68

A patient's story

Patients and carers at TRFT regularly take part in satisfaction surveys and provide us with a wealth of information about our services. Recent comments from surveys have suggested that they would like to see more feedback about how we have responded to their feedback.

Staff experience

We asked 77 staff the following questions:

	Net Promoter Score
I would recommend this ward/unit as a place to work	19
I would recommend the standard of care on this ward/unit to a friend or relative if they needed treatment	26
I am satisfied with the quality of care I give to the patients, carers and their families	30

3. IMPROVEMENT

Improvement story: we are listening to our patients and making changes

As a result of information received about our services from patients and carers which suggested that they would like to see more feedback about how we have responded to their feedback a group of willing matrons and administration staff have got together to devise a new patient experience dashboard. This dashboard provided information to people who attend/visit ward and department areas exactly how their feedback has changed over the last few months and gives them information on action taken. This is a truly 'bottom up' approach to sharing feedback both with patients and staff.

We are really excited about our new dashboard. We are currently working with patient groups to determine colour, size and positioning of the dashboards and hope to have them in place by end January 2015.
